# PageRank computation

E5, September 22, 2021

## Exercise #2

Compute the PageRank values for the following graph for three iterations using q=0.5.

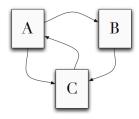

Figure 1: Web graph for Task 1

## ${\bf Algorithm}$

- In Iteration 0, all pages are given equal page rank  $\frac{1}{T}$  (where T is the number of pages)
- $\bullet$  For Iterations 1–3, substitute the values and compute new PageRank values using Equation 1

$$PR(a) = \frac{q}{T} + (1 - q) \sum_{i=1}^{n} \frac{PR(p_i)}{L(p_i)}$$
(1)

#### Solution

| Page | L(p) | Iteration 0 | Iteration 1 | Iteration 2 | Iteration 3 |
|------|------|-------------|-------------|-------------|-------------|
| A    |      |             |             |             |             |
| В    |      |             |             |             |             |
| С    |      |             |             |             |             |

Table 1: PageRank values.

### Exercise #3

Compute the PageRank values for the following graph for three iterations using q=0.15.

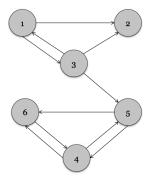

Figure 2: Web graph for Task 2

### Algorithm

- Initially, all pages are given equal page rank  $\frac{1}{T}$  (where T is the number of pages)
- ullet Substitute the values and compute new PageRank values using Equation 2
- Repeat for the required number of iterations
- Notice that node 2 is a rank sink (no outgoing links); pretend that it links to all other nodes (including itself)

$$PR(a) = \frac{q}{T} + (1 - q) \sum_{i=1}^{n} \frac{PR(p_i)}{L(p_i)}$$
(2)

#### Solution

| Page | L(p) | Iteration 0 | Iteration 1 | Iteration 2 |
|------|------|-------------|-------------|-------------|
| 1    |      |             |             |             |
| 2    |      |             |             |             |
| 3    |      |             |             |             |
| 4    |      |             |             |             |
| 5    |      |             |             |             |
| 6    |      |             |             |             |

Table 2: PageRank values.
